

Arrays
→ using list in python

Strings

Index & method
sort()

① Logic

→ Detailed answers

→ if else
→ for loops

②

→ create function, calling, returning

DSA
→ Data structure and algorithm

→ arrays

→ strings

→ stacks

→ queue

→ linked list

→ graphs

→ trees

→ to solve a problem.

→ sorting, searching, pattern, Dijkstra's, Greedy, etc.

③ Read a question, understand
→ input, output

④ solve it with considering time complexity

Pattern ① Two pointer

→ ① sorted, non-decreasing order, pair that sums to, palindromes, rampans

② nested loops (n^2)

→ $O(n)$

[1, 2, 3, 4, 5, 6] or "ali na"

l=0
r=pendu

while (left < right):

left half
left++

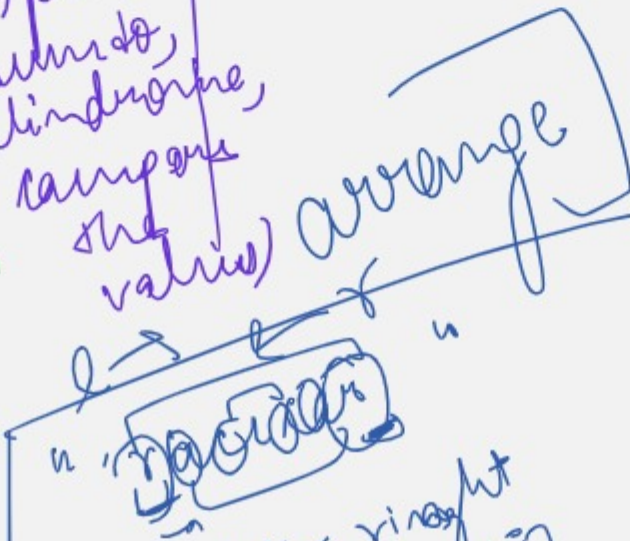

right half
right--

else left > right--

Pseudo

add

left < right

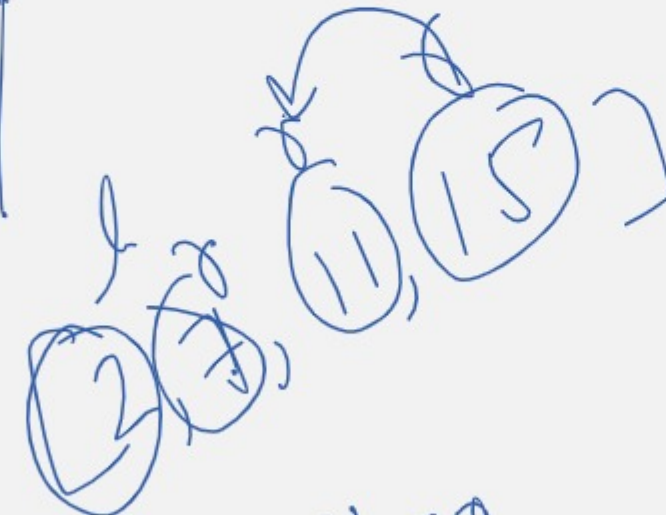

s[left] != s[right]

not

left++

right--

return "palindrome"

left = 0

r = 3

(sorted array)

while left < right:

current_sum = num[l] + num[r]

if
